

INSTALLATION AND USER GUIDE

MDM

Mac Download Manager

A download manager for Apple Silicon Macs. Its extensions for Chrome, Brave, Edge, Opera, Vivaldi, Arc, Yandex, Firefox and Safari catch your downloads and speed them up; it also downloads videos, playlists, torrents and dubbed audio tracks with one click.

NEW: Turkish/English interface, embedded subtitles, folder rules

8-32 connections

Splits a file into parts and downloads them at once.

Videos and playlists

YouTube, Vimeo, X, Instagram; quality, dub and subtitles.

Torrents

Magnet and .torrent; search in legal sources.

All browsers

Chrome family, Firefox and Safari extensions.

DOWNLOAD THE LATEST VERSION (click)

MDM.pkg · recommended

MDM.dmg

github.com/savascitaner/idm-mac/releases/download/latest/MDM.pkg

The links always give the newest version. The app also updates itself.

Installation steps

Double-click the **MDM.pkg** you downloaded; the installer does the rest. The app is signed and notarized by Apple, so no extra security setting is needed.

1

Open MDM.pkg

In the installer press **Continue** and **Install**. MDM is installed into **Applications** and opens by itself; no dragging needed. You can also use **MDM.dmg**: drag MDM to Applications.

2

First launch

If macOS asks about an app downloaded from the internet, press **Open**. No other permission is needed. When MDM opens you get the main window and an icon in the menu bar.

3

Language

The interface follows your Mac's language: Turkish on a Turkish system, English on any other. To change it use **Settings > Appearance > Language**; it applies after MDM relaunches.

4

Install the browser extension

On first launch MDM shows the extension window (later you can open it with the **puzzle icon** in the toolbar). The next page explains the steps for your browser.

The screenshot displays the MDM application interface. On the left, a sidebar lists categories: İndirmeler (Downloads), Torrent, and Kategoriler (Categories). The main area shows a list of downloads with progress bars and details. The right sidebar provides summary statistics and a detailed view of the selected download.

Download Name	Progress	Speed	Status
macOS-Tahoe-Installer.dmg	3.46 GB / 4.8 GB - %72	17.9 MB/sn	İndiriliyor
Lo-fi müzik, 1 saat (1080p)	338.2 MB / 860 MB - %39	6.2 MB/sn	Duraklatıldı
ubuntu-24.04-desktop-amd64.iso	2.67 GB / 6.1 GB		Duraklatıldı
Fotografılar-2026.zip			Hata: Sunucu bağlantıyı kesti
podcast-bolum-42.mp3	Tamamlandı - 64 MB		Tamamlandı
Proje-Sunumu.pdf	Tamamlandı - 18.4 MB		Tamamlandı

Summary Statistics:

- Toplam İlerleme: 1.86 GB, %67, 1 dk 17 sn
- Anlık hız: 24.1 MB/sn, son 1 dk en yüksek: 31.5 MB/sn
- Etkin: 2, 0 sırada - 1 duraklatıldı
- Bugün: 82.4 MB, 2 dosya tamamlandı

Detailed View (macOS-Tahoe-Installer.dmg):

- Progress: %72, 3.46 GB
- Parça haritası: 8 parça, 1 bitti, 7 %32-%92
- Hız: 17.9 MB/sn

Main window. Categories on the left, downloads in the middle, details on the right.

Setup by browser

Chrome, Brave, Edge, Opera, Vivaldi, Arc, Yandex

Chrome

Brave

Edge

Opera

Opera GX

Vivaldi

Arc

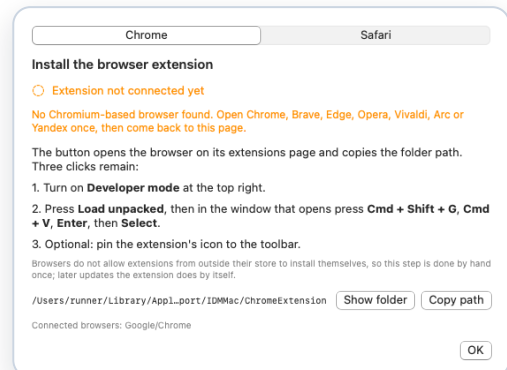

Yandex

All of these use the same extension. MDM's extension window has a separate button for every installed browser. The button opens the browser on its extensions page and copies the folder path. Three clicks remain:

- Turn on **Developer mode** at the top right.
- Press **Load unpacked**; in the window that opens press **Cmd+Shift+G**, **Cmd+V**, **Enter**, then **Select**.
- Optionally pin the extension's icon to the toolbar.

When the extension connects, the orange text in the window turns into a green "connected". Browsers do not let extensions from outside their store install themselves, so this step is done by hand once; later updates the extension does by itself.

Extension pages: Chrome **chrome://extensions**, Brave **brave://extensions**, Edge **edge://extensions**, Opera **opera://extensions**, Vivaldi **vivaldi://extensions**, Arc **chrome://extensions**, Yandex **browser://extensions**.

Extension window. A separate button for every browser.

FIREFOX

If you use Firefox

1. In MDM's extension window press **Firefox: open the debugging page** (**about:debugging** opens, the path is copied).
2. Choose **This Firefox > Load Temporary Add-on**; press **Cmd+Shift+G**, **Cmd+V**, **Enter** and pick **manifest.json**.

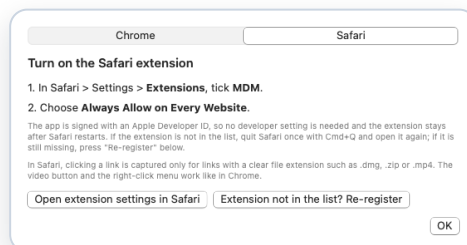

A temporary add-on is removed when Firefox quits. A signed version for permanent installation is in preparation.

SAFARI

If you use Safari

1. In **Safari > Settings > Extensions** tick **MDM**.
2. Choose **Always Allow on Every Website**.
3. If the extension is not listed, quit Safari with **Cmd+Q** and open it again; if it is still missing, press **Re-register** in MDM's extension window.

Because the app is signed by Apple no developer setting is needed. In Safari, clicking a link is captured for links with a clear file extension such as .dmg, .zip or .mp4; MDM also takes over downloads that Safari starts itself.

What can it do?

From a simple download to video, torrents and a scheduler, everything in one app.

Fast downloads

1-32 connections per file; resumes a half-finished download where it stopped. Waits when the network drops and continues by itself.

Video, playlists and audio

Downloads the video on a page with the quality and dub you choose; takes playlists one after another; audio only if you like.

Subtitles

Embeds the video's subtitles (made by the uploader and YouTube's automatic captions) into the mp4. Settings > Video.

Torrents

Magnet and .torrent; search in legal sources (the Internet Archive, official Linux distributions). Also downloads torrents that have web sources.

Scheduler and speed

Download only during the hours you set; speed limit and slow mode; put the Mac to sleep or shut it down when done.

Organization

Sorts downloads into subfolders by type (Video, Music, Archives, Apps, Documents). Off if you prefer.

Queue and priority

Move a waiting download to the front or the end of the queue. You choose how many download at once.

Checksum

Right-click a download: calculate SHA-256 and compare it with the value on your clipboard.

Menu bar panel

Speed graph, slow mode button, add from clipboard; drop a link or a .torrent file on the panel.

Clipboard watch

Copy a file, video or magnet link and a notification appears; just press **Download**.

Updates itself

When a new version is out, update with one click from the blue bar, or let it update by itself.

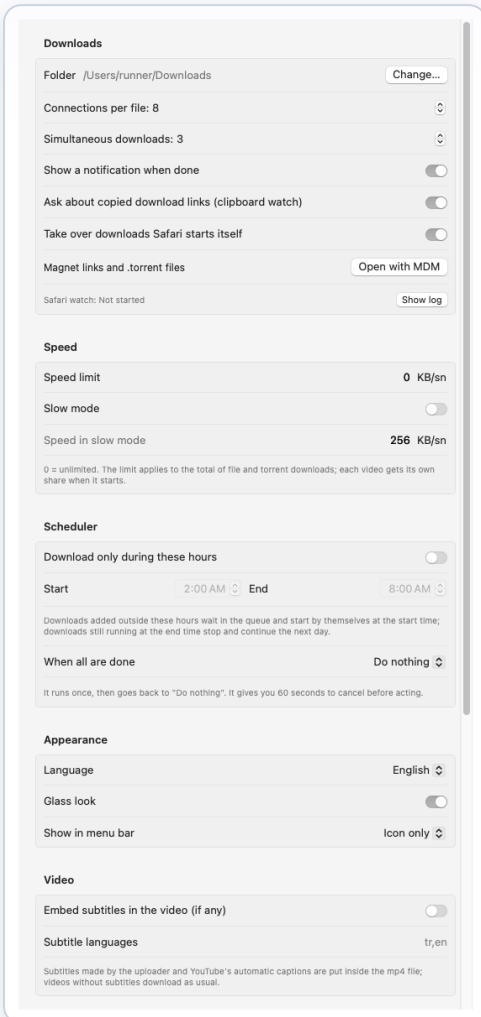

Turkish and English

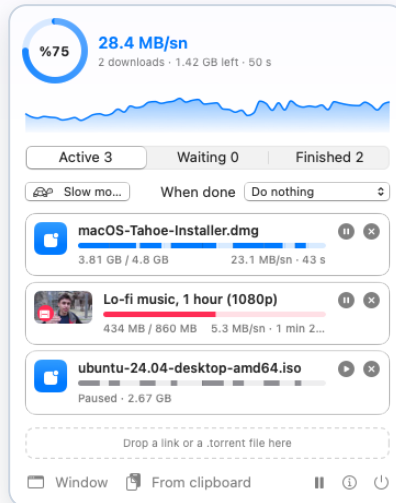

Follows your Mac's language; change it in Settings > Appearance > Language.

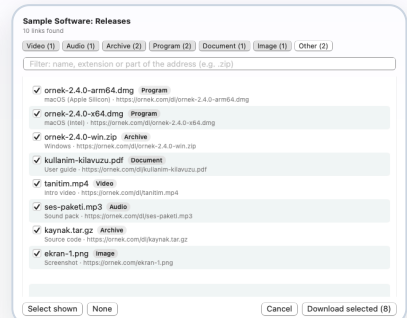

A closer look

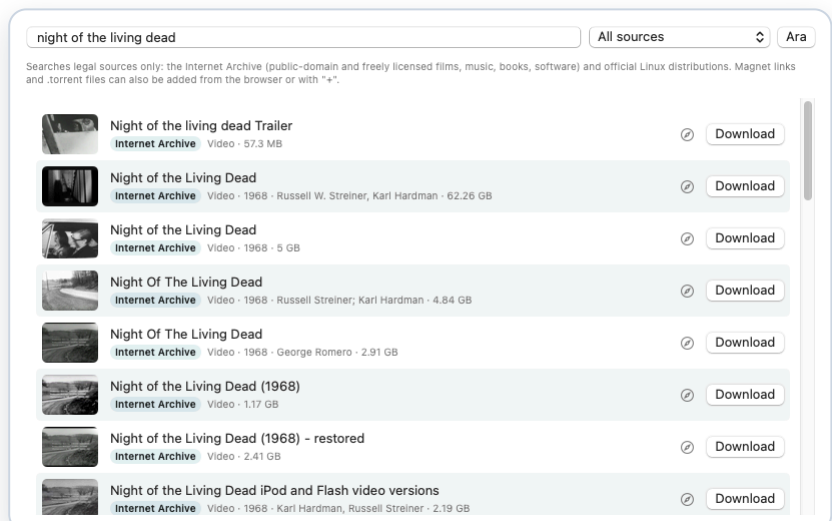

Settings. Language, glass look, speed limit, scheduler, subtitles, folder rules and updates.

Menu bar panel. Speed graph, **Slow mode** and the "When done" option.

All links on a page. Right-click the page or choose "List all links" from the extension icon; filter by type, select, download.

Search torrents. Searches legal sources only; download a result with one click.

When you get stuck

Quick tips: `⌘ (Option)`-click a link and the browser downloads it itself. **Cmd+Shift+Y** (Chrome family) downloads the video on the page. From the extension icon you can turn off a site or leave small files to the browser.

The extension says "not connected"

Quit and reopen the browser. On its extensions page check that the MDM extension is on and that the folder is **Application Support/IDMMac/ChromeExtension**.

No MDM extension in Safari

Quit Safari with `Cmd+Q` and open it again. If it is still missing, use the puzzle icon in MDM > Safari tab > **Re-register**.

A site will not give MDM the file

Some sites (subtitle sites, for example) hand out the file only from their own page. MDM does not capture those or gives the download back to the browser, which downloads it.

How do I update?

A blue bar appears above the main window: **Update and relaunch**. You can also check by hand in Settings > Updates.

Download at night, then sleep

In Settings > Scheduler pick the hours, and in "When all are done" choose **Put the Mac to sleep** or **Shut down**. It runs once.

My internet got very slow

Turn on **Slow mode** in the MDM panel in the menu bar; set its speed in Settings.

A torrent stays at 0

Some torrents have nobody sharing them. After 45 seconds MDM tries the web source; the status line says what it is doing.

Log files

Settings > Updates > **Show diagnostic log**. Attach this file when you report a problem.
